

## Luxury Portable Shower Requirements

- Portable showers are 2.34 metres high, 1.12 metres square and weigh 84 kilograms. Our representatives use a hand trolley suitable for hard flat surfaces to move the shower unit. If the shower needs to be carried into place please ensure an able bodied person is able to assist our representative on delivery and pick up. The shower needs even more head room if it is to be tilted into position
- The shower needs to be placed on a reasonably hard level surface. Waste water from the shower drains through a 32mm flexible hose on to your garden or lawn. Drainage needs to flow down hill away from the shower. Waste water can flow in to your sewer through your overflow relief gully or inspection opening if possible. Waste water can not enter your storm water system or street kerb.
- A 10 AMP power point is required within 25 metres of the shower. The hot water system can not share a power point (single or double) with any other appliances. The hot water system draws 2400 watts. (2.4 kilowatts) Please ensure you have ample power especially with multiple hot water systems.
- A garden tap is required. Check to see if your garden tap leaks.
- If we are unable to deliver and install or pick up the shower unit as per the hire agreement you may forfeit your hire and delivery fees or be subject to further costs.

Just like your bathroom at home!
